Game Engines

- **Unity** – ~70% of all mobile games, ~50% of all Steam games
 - “50% of games across devices are made with Unity” – Unity, 2022
- **Unreal** – ~15% of all Steam games, much higher percentage on consoles
- **Godot** – the biggest/most famous open-source engine
-
- Lots of other engines or frameworks
 - GameMaker, XNA, CryEngine, Construct, RPG Maker, Frostbite, Source, id Tech...

Unity

- Free
 - Cannot earn/raise more than \$200k/year
 - Unity Splash Screen OPTIONAL
- Pro €2.000/seat/year
 - Access to Pro Analytics, Team tools...
 - **Needed to deploy to consoles – Xbox/PS/Switch** (platform devkit still required)
- Asset store: full of interesting models/scripts/tools
- Source code access: **EXPENSIVE** (Pro/Enterprise license)
- Scripting in C# (or visual scripting)

<https://unity.com/products>

Unity platforms

- Editor: Windows/Mac/Linux
- Release platforms:

iOS

macOS

 Windows

 Meta

visionOS

tvOS

 ARCore

Magic Leap 

androidtv

Unreal

- Free to use
- 5% royalties to Epic Games
 - For every dollar you earn above \$1M
 - Can reduce this if you release on Epic Games Store
- Source code access: **YES** (for most parts of the engine)
 - Not open source, only source available
- Marketplace
- Scripting: C++, Blueprints (visual scripting)
 - Has bindings for other languages

Unreal platforms

What platforms does UE5 support?

Unreal Engine 5 enables you to deploy projects to Windows PC, PlayStation 5, PlayStation 4, Xbox Series X, Xbox Series S, Xbox One, Nintendo Switch, macOS, iOS, Android, ARKit, ARCore, OpenXR, SteamVR, Oculus, Linux, and SteamDeck. You can run the Unreal Editor on Windows, macOS, and Linux.

PlayStation 5, PlayStation 4, Xbox Series X, Xbox Series S, Xbox One, and Nintendo Switch console tools and code are available at no additional cost to developers who are registered developers for their respective platform[s].

Godot

- Free forever and open source
 - Community-driven and community-built
- Gained a lot of popularity in the last few years
- Not that feature-complete as Unity/Unreal
- Can buy assets on a few sites, but much smaller support than Unity/Unreal
 - Also much smaller (but more active) community
- Scripting
 - GDScript – similar to python
 - C/C++ – official support
 - C# – limited for mobile devices

Godot 4.7 Platforms

- Windows, Mac, Linux
- HTML5
- Android, iOS
- [Consoles](#)
 - Cannot be part of Godot directly
 - There is a studio porting to consoles made by Godot authors

Note

In practice, the process is quite similar to Unity and Unreal Engine, except that you need to contact a third-party developer to handle the porting process. In other words, there is no engine that is legally allowed to distribute console export templates without requiring the user to prove that they are a licensed console developer. Doing so would violate the console manufacturer's NDA.

Picking an engine

- License/pricing – very important
- Features & other support
 - Anything except Unity/native on mobile will be complicated
 - Mobile f2p games rely heavily on service SDKs
- Some engines are more suited for some games
 - Unreal – shooters, aspirations to do AA/AAA development
 - It is said to have worse performance on mobile – but I cannot verify this
 - Unity – mobile, indie PC/Console

Why Unity

- Free for small devs, inexpensive for bigger ones
- I have 10+ years experience, can provide better support
- Easier to learn than Unreal
- Editor has better performance and lower requirements than Unreal
- More feature-complete compared to Godot
- De-facto standard for indie/mobile development

Unity

Recommendations

- Use Unity Hub to manage Unity installations
- Start new projects with the latest LTS version (**6000.3.25f1** now)
- Don't just automatically update Unity
- The only reasons to update a project:
 - New bugfixes you need
 - New features you need
 - Will be using Unity 6.6 (**6000.6.2f1**)
 - Fast Enter Play Mode

Interface overview

- Scene View
- Hierarchy
- Game View
- Project Panel
- Inspector
- Toolbar

Basic Concepts

- Game Objects
- Components
- Prefabs
- Importing assets
- Project Preferences
 - Other project settings
- Build

Scripting

- Adding, naming, renaming, removing C# scripts
- Visual Studio
- `GetComponent<Type>()` -> LOW PERFORMANCE!
- `Input.GetKey()`
- Renderer component -> material color
- Private and public variables, linking with editor
 - Assigning prefabs/existing game objects to variables
- `Awake()` and `Start()`
- `Update()` and `FixedUpdate()`

Scripting (2)

- `Vector3` class and utility functions -> `magnitude`, `Dot`, `Cross`, ...
- `Component.enabled` and checkboxes in editor
- Adding mesh filters, renderers and materials
- `GameObject.SetActive()` and checkboxes in editor
 - `GameObject.activeSelf`, `GameObject.activeInHierarchy`
- Visual Studio debugging
- `Transform` component

Scripting (3)

- `Vector3.forward`, `Vector3.right`, `Vector3.up`
- `Time.deltaTime` in `Update()`
- `Vector3.Lerp`
- `GameObject.Destroy(GameObject[, time])`
- `GameObject.Destroy(Component[, time])`
- `Input.GetButton...`
- Access scripts of other Game Objects
- `Instantiate()`
- Value vs. Reference types
